

Parking lot USB exercise

Contents	Write 2-3 sentences about the types of information found on this device. <i>Jorge's drive contains an assortment of personally identifiable information (PII). It also contains sensitive work-related files such as hospital operations together with his personal files. Storing personal files with work files is a risk if not handled properly. So it is important to keep personal and business USB drives separate.</i>
Attacker mindset	Write 2-3 sentences about how this information could be used against Jorge or the hospital. <i>Easily lost or stolen Information found from the drive can be used against employees, relatives, the business, and the owner. If the drive is intentionally left by an attacker, the person who finds it and plugs it into their computer may unknowingly expose sensitive information that could be used against them or the organization. Examples are the timesheets that can provide an attacker intel about other people that Jorge works with, either work or personal information could be used to trick Jorge, or a malicious email can be designed to look as though it comes from a coworker or relative.</i>
Risk analysis	Write 3 or 4 sentences describing technical, operational, or managerial controls that could mitigate these types of attacks: <i>Attackers can use USB drives to infect other computers with malware once plugged into a computer and download malicious code. Information like the PII or SPII can be found and used by a threat actor to steal information directly from a computer. It can also result to identity theft, damage reputation to the organization, and unauthorized access.</i>

Remediation	Promoting employee awareness about these types of attacks and what to do when a suspicious USB drive is a managerial control that can reduce the risk of a negative incident. Setting up routine antivirus scans is an operational control that can be implemented. Another line of defense could be a technical control, like disabling AutoPlay on company PCs that will prevent a computer from automatically executing malicious code when a USB drive is plugged in. Lastly, separate personal and business USB drives.
